                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      US-09-404-879A-340/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PATENT NO. 646546

GENERAL INFORMATION:
APPLICANT: Mitcham, Jennifer L.
APPLICANT: Mitcham, Jennifer L.
APPLICANT: King, Gordon E.
APPLICANT: Algate, Paul A.
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY AND TITLE OF INVENTION: DIAGNOSIS OF OVARIAN CANCER FILE REFERENCE: 210121.462C2
CURRENT APPLICATION NUMBER: US/09/404,879A
CURRENT FILING DATE: 1999-09-24
Sequence 1, Application US/08282141 Patent No. 5538861
                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

This sequence encodes the mouse A55 protein. The invention relates to the human A55 protein. The protein can be used for the treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be used according their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or re-narrowing by vascular endothelial thickening after percutaneous transluminal coronary angioplasty (PTCA), or myoma, haematopoletic cell-regulatory activity, cytokine activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity, receptor/ligand activity, actin/thmour metastasis inhibiting activity; tumour inhibition, and a anti-riant
                                                                                                                                                                                                                                             Novel human polypeptides myoma -

                                                                                                                                                                                                                                                                           The invention provides mouse polypeptides for treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be produced by standard recombinant methodology. The polypeptides can be used according to their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or remarrowing by vascular endothelial thickening after percutaneous transuluminal coronary angiopiasty (PTCA), or myoma, hematopoietic cell regulatory activity, cytokine activity, tissue generation/reparation activity, actin/inhibitin activity, taxis and chemotaxis activity, but coagulation/thrombotic activity, receptor/ligand activity, addohelin/tumour metastasis inhibiting activity; tumor inhibition, and as nutrice The present sequence represents a DNA encoding the protein of the invention which can be used for modulating smooth muscle cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          endothelial thickening; percutaneous transuluminal coronary angioplasty; myoma; hematopoletic cell-regulation; cytokine; tissue generation; taxis actin activity; chemotaxis; blood coagulation; thrombotic; tumor; mouse;

```

to abnormal proliferation of smooth muscle. The polypeptides can be produced by standard recombinant methodology. The polypeptides can be used according to their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or renarrowing by vascular endothelial thickening after percutaneous transuluminal coronary angioplasty (PPCA), or myoma, hematopoletic cell-regulatory activity, cytokine activity, tissue generation/reparation activity, actin/inhibitin activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity, receptor/ligand activity, cadohelin/tumour metastasis inhibiting activity; tumor inhibition, and as nutrient. The present sequence represents the coding sequence of one protein of the invention which can be used for modulating smooth muscle cell proliferation invention provides mouse roliferation of polypeptides for treatment of diseases

proliferation, to treat Marfan syndrome, to stimulate wound healing, to restore normal neurological function after trauma or AIDS dementia, to treat coular disorders, to treat kidney and liver disorders, to promote hair follicular development, to stimulate growth and differentiation of epidermal and epithelial cells in vivo and in vitro, for the treatment of burns, ulcers and corneal incisions, and to stimulate embryogenesis and anglogenesis.

Nucleic acid fragments are also used as probes or primers, e.g. for dispress and dispress and anglogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      expression in bacterial, insect, mammalian or plant cells. EEGF polypeptides, and polynucleotides encoding them, can be used e.g. to induce DNA synthesis, to regulate vascular smooth muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This claimed cDNA clone codes for a human polypeptide (see AAW31705) identified on the basis of homology as a putative extracellular protein-like/epidermal growth factor-like (EEGF) protein. It was isolated from a human foetal heart cDNA library, and can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid encoding extracellular/epidermal growth protein - useful for treatment and diagnosis of e.g. neurological disease, neoplasia, psoriasis etc

```

present

polypeptide. The specification describes human polypeptides, designated PR0196, PR0444, PR0183. PR0185, PR02115, PR0217, PR0217, PR0242, PR0288, PR0365, PR01361, PR01308, PR01183, PR01272, PR01419, PR04999, PR07170, PR0248, PR0353, PR01318, PR01600, PR09940, PR0533, PR0301, PR0187, PR0248, PR0353, PR01318, PR01600, PR09940, PR0533, PR0301, PR06003, PR0377, PR04356, PR0246, PR0265, PR0941, PR010096, PR06003, PR0301, PR0350, PR0350, PR0350, PR0530 and PR06009, PR0910cal activity of cells can be modulated with agents that bind to these polypeptides, resulting in the death of the cells. The polynucleotides encoding these polypeptides are useful in the recombinant production of the polypeptides, as a hybridisation probe to screen libraries to isolate homologous sequences, or to map the gene. They may also be used for analysing genetic disorders, and to produce transgenic animals which are useful for the development and screening of therapeutically useful reagents. The polypucleotides can also be used in gene therapy e.g. to reagents. The polynucleotides can also replace a defective gene. sequence encodes a human secreted and transmembrane

(I), its (ant)agonis or fragment can also be used as an adjuvant in treatment of tumors. Antibodies against (I) can also be used for diagnosing such diseases. This sequence encodes a human ECF-like homologue (PRO217) encoded by clone DNA32279 which is described in the invention.

Composition containing WPI; novel polypeptide PRO245, agonist

ΣH

1; Fig 5A-1-5A-2; 177pp; English

Crarrier or excipient), a novel composition containing (apart from a containing or excipient), a novel PRO245 polypeptide (I), its agonist or cantagonist, or their fragments, for modulating: (1) infiltration of clinidammatory cells into tissue; (ii) an immune response; or (iii) T cell composition increases or decreases any of the effects (i)-(iii). The products of the invention have anti-inflammatory, calls into tissue; (ii) an immune response; or (iii) T cell composition increases or decreases any of the effects (i)-(iii). The products of the invention have anti-inflammatory, can anti-diabetic activity. (I), and its (ant)agonists cand their fragments, are used to treat immune-related diseases, decreased include systemic lupus erythematosus, rheumatoid arthritis, juvenile chronic carthritis, spondyloarthropathies, systemic sclerosis (scleroderma), cidiopathic inflammatory myopathies (dermatomyositis, polymyositis), comparative inflammatory disease, didopathic thrombocytopenia, thyroiditis, atrophic comparative menalitis, juvenile lymphocytic thyroiditis, atrophic comparative menalitis, primary biliary cirrhosis, multiple sclerosis, idiopathic demyelinating polyneuropathy, infectious hepatitis comparative hepatitis, primary biliary cirrhosis, granulomatous contentive hepatitis, primary biliary cirrhosis, granulomatous contentive mercopathy, and which mandatory bowel disease including bullous skin disease, arythema multiforme, contact dermatitis, psoriasis, combined and content dermatitis, psoriasis, and content dermatitis, psoriasis, and bullous skin disease, arythema multiforme, contact dermatitis, psoriasis,

CC polyniclectice sequence was obtained from a human foctal kidney cDNA CC library. AK647 homologues in chicks and rodents are involved in aortic tissue development. The spatial and temporal distribution of AK647 CC indicated that it acts as an a modulator of smooth muscle cells in CC vasculogenesis during embryonic development. The primary structure of EC AK647 consists of multiple EGF domains. The AK647 protein can be used as nutritional source or supplement. The protein shows both inhibitory and conditional control of inducing, cytokine, cell proliferation and cell differentiation activity. CC The protein may also be used in the treatment of immune deficiencies and cother viral, bacterial and fungal infections. Regulation of immune cc responses may also be carried out by the AK647 protein. Other uses of the protein include a role in the regulation of haematopoiesis and in the treatment of myeloid and lymphoid cell deficiencies. Uses in bone, CC cartiliage, tendon, ligament and nerve tissue regrowth are also possible, as well as for wound healing and in the treatment of ulcers and burns. CC may also have activin/inhibin, chemotactic/chemokinetic, haemostatic and thrombolytic, receptor/ligand, anti-inflammatory, cadherin/tumour inhabition activity. AK647 specific contibodies can be used for promoting smooth muscle cell growth or vasculogenesis. The proteins and polynucleotides can also be used for detection. disgnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 45-46; 49pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is that encoding a secreted protein from a human fetal kidney clone AK647. Such a sequence is predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haemostating activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, and tumour invasion suppressor activity, and tumour inhibition activity. It is also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention.
                                                                                                                                                                                                                                                                         08-JUL-1999;
